

Clinical Audit Report

1. Summary

Based on the analysis, it is evident that HCC is PRESENT with a HIGH risk level. The patient's overall condition is of high concern, indicating a need for immediate attention. The risk level is a clear indication of the severity of the situation.

2. Risk Assessment

Overall Patient Risk → HIGH (53.45428179110043)

3. Explanation

Overall Patient Risk

The patient's records show repeated medical interactions and consistent patterns over time. These patterns suggest a higher level of risk, as similar conditions have been observed across multiple visits. This indicates that the issue is not isolated and may require closer monitoring.

4. Recommendation

It is recommended that the patient undergoes regular monitoring to track the progression of the condition. Follow-up appointments should be scheduled to reassess the risk level and adjust the treatment plan accordingly. Additionally, a comprehensive review of the patient's medical history is necessary to identify any underlying factors contributing to the high risk level.

5. Citations

Overall Patient Risk → The patient's history and repeated visits have led to a consistent pattern of risk, indicating a need for closer monitoring and follow-up appointments.
